This is not an attempt to sell you anything and you can be removed from the email list at any time by replying to my email with REMOVE in the subject line.

WEEK #20

Is there a way to increase the internet browsing and download speed on Windows Vista? (should only be done by advanced users)

Answer:

Yes. With windows Vista you have noticed the slow internet speed. The web browsing and downloading speed is very slow as compare to previous versions of windows. You can open the same sites in windows XP and server 2003 with the normal speed.

Follow the given steps to increase the Vista browsing speed:

First go to Advance tab in Internet Explorer and turn off the TLS (Transport Layer Security) encryption option. Here to fix problem with some secure pages turn on the SSL 2.0 (Secure Sockets Layer) feature and click Ok button to close it.

In windows Vista, the TCP autotuning feature is enabled by default. Some web servers do not respond properly to this feature, so it appears that some sites open with very slow speed.

To use this feature, you will need to be logged into your computer with administrative rights.

First click on Start button and type **CMD** in Run option then press Enter.

At Command Prompt, type the following command and press enter.

```
netsh interface tcp set global autotuninglevel= disabled
```

This command will disable the TCP autotuning feature. Now close the command Prompt and restart your computer after any changes to go into

effect.
